"Cryostat for Studying Optical Absorption under Uniaxial Compression"

Moscow, Pribory i Tekhnika Eksperimenta, No 6, 1971, pp 181-182

Abstract: The structural design and operating characteristics are presented for a cryostat designed to investigate the optical absorption spectra in semiconductors under uniaxial compression to 160 kg at T = 78 and 300° K. The force on the sample in the cryostat is created by a pneumatic chamber, and with a sample cross section of $4 \times 0.5 \text{ mm}^2$, the pressure is $\sim 8 \text{ tons/cm}^2$. Absorption spectra are presented for tellurium investigated in the presented cryostat using the UR-20 infrared spectrophotometer at T = 78° K. The spectra are presented for pressures of p = 0, 900 and 1,200 kg/cm². The light was polarized parallel to the crystallographic C-axis of the tellurium, and the direction of the compression was parallel to the C-axis. The cryostat can also be used for measurements on the IKS-21 spectrophotometer.

"Inversion Phenomenon in Five-Layer Structures"

Yerevan, Izvestiya Akademii Nauk ArmSSR: Fizika, Vol 8, No 3, 1973, pp

Abstract: The authors find the current-voltage characteristic of a PNPNP structure when $\beta_2+\beta_3>1$, and they study the condition of formation of sections with negative resistance on the current-voltage characteristic. It is shown that inversion of the sign of voltage displacement occurs on the central collector junction. Formulas are derived for the extremum points of the function V(I), and the existence of an intermediate interval with positive differential resistance is demonstrated. A new mechanism is suggested for the formation of negative resistance on the current-voltage characteristic of the fourth junction.

"Regular Variations Of The Intensity Of Generation Of A Glass Fiber Laser Activated By Neodymium"

Kvantovaya clektronika, Moscow, No 5, May 71, pp 120-122

Abstract: The regular pulsations of generation intensity resulting from the appearance of absorptive centers in the glass fiber are investigated. The experiments were conducted on fibers activated by Nd²⁺120 cm long and 27-35 micromater in diameter (diameter of core 20-25 micromater) mixed in a reflector with flowing distilled water. Fumping was produced by two IFP-5000 gas-discharge pulse lamps. The time characteristics of the emission were studied with the aid of a FEU-22 photomultiplier on a S1-29 oscillograph. The concentration of absorptive centers was varied with the aid of an aqueous solution of K₂Cr₂O₇, cutting off the ultraviolet part of the spectrum. The dependences of the period of the pulsations and the generation delay time on the pump power were investigated. An anomalous growth of the pulsations period with an increase of the pump power was displayed, caused by the absorptive layers in the glass. The

Tbilisi, Soobshcheniya Akademii Nauk Gruzinskoy SSR, vol 68, No 1, 1972, pp 53-56

Abstract: This paper is the continuation of an earlier article by the same authors in the same journal mentioned above (Programma i tezisy 22-go yezhegodnogo soveshchaniya po yadernoy spektroskopii i strukture atomnogo yadra — Program and Theses of the 22nd Annual Conference on Nuclear Spectroscopy and Atomic Nucleus Structures—part 1, Leningrad, 1972, p 216; Soobshcheniya AN GSSR, 66, No 3, 1972, p 565) investigating the development of the K-harmonic method as applied to the nucleon association model. By using formulas developed in the earlier article together with the Reinal and Revai coefficients, the authors obtain in the present article expressions for the charge form factors of Li6, Be9, and Cl2 three-particle nuclei. The authors promise a future article comparing the results of the present paper with available experimental data.

"Effect of Magnetomechanical Annealing on the Characteristics of Thin Iron-Nickel Films"

Sverdlovsk, Fizika Metallov i Metallovedeniye, Vol 32, No 3, Sep 71, pp 575-578

Abstract: New experimental results are discussed of the influence of mechanical stresses, applied in the process of magnetic annealing, on properties of Permalloy films with different parameters produced by vacuum vaporization with constant magnetostriction of different sign and magnitude. Reference is made to diagrams showing the dependence of the anisotropy field, the magnetoelastic parameter, and the magnitude of residual stresses 62 on the annealing temperature and the effect of magnetomechanical annealing on 62/61, where 61=theoretical maximum stress. The constant monoaxial anisotropy magnitude at room temperatures over a period of more than 2.5 years is emphasized as an important feature arising in the process of magneto-1/1 mechanical annealing. 3 illustr., 3 biblio. refs.

"Change in Marmettelastic Constant of Thim Ferromagnetic Films With Magnetic Annealing Along the Amis of Difficult Magnetization"

Sverdlovsk, Picika Marchlov i Netallovedamiya, Vol 30, No 2, Aug 70, 77 JSC-555

Abstract: The influence of the angular dispersion of anisotropy on the value of the magnetoclastic parameter is studied theoretically and experimentally. In films with high angular dispersion of anisotropy, a nonlinear sector is naked on the curve $H_{\Gamma}(t)$ in the areas of low intensities, leading to a decrease in the apparent magnetic clastic constant. In order to determine the true implicitly clastic constant, in these be determined with high deformations in the linear sector of $H_{\Gamma}(x)$. The experiments by observed nonlinear sector of $H_{\Gamma}(x)$ can be qualitarively explained by dispersion of the direction of $H_{\Gamma}(x)$ acquainzation.

"Detonation Gas-Dynamic Laser"

Moscow, Pis'ma v Zhurnal Eksperimental'noy i Teoreticheskoy Fiziki, Vol 14, No 2, 20 Jul 71, pp 73-76

Abstract: This article describes a new type of gas-dynamic laser in which the solid material is detonated to obtain the initial high-temperature gas mixture. Previously the high-temperature mixture was obtained in the gas-dynamic lasers by the passage of shock waves in the gas media and by heating with an electric arc or by igniting the initial gases. The use of detonation of the solid material permits varying the initial pressure and temperature of the gas mixture in a wide range and also substantially simplifying and reducing the dimensions of the experimental set-up. Figure 1 shows a schematic of the experimental set-up; Figure 2 is an oscillogram of the impulse of generation, 500 usec/unit; and Figure 3 shows the output energy. The authors state that by using liquid nitrogen in the described set-up, they can experimentally place the initial material in the reaction volume. By the use of other materials 1/2

"Thermally Insulating Plates Based on Superfine Basalt Fibers"

Moscow, Stroitel nyye Materialy, No 12, Dec 73, pp 19

Abstract: The basalt superfine fibers (BSFF) have a diameter less than 2 microns. These fibers are the base for the preparation of a soft, very effective insulation material which may be used in the temperature range -200 to +700° C. The BSFF have a high resistance to vibrations, acid, and steam. Values for specific volume, bonding hydroscopic tendency and rigidity are given as a function of plate thickness from 2 to 9.8 mm. The plates are prepared from a polyvinylacetate emulsion having a fiber concentration of 1.5 to 5 g/l of the BSFF. The plates were dried with a corresponding loss of weight of between 0.2-0.3%. These BSFF plates have the advantage of being composed of readily available materials and of having a short processing time -- 2-3 times less than that presently required for processing.

CONCERNING THE SPECIFIC PROPHYLAXIS OF DYSENTERY.
REPORT VI. THE EFFICACY OF ENTERAL IMMUNIZATION
WITH LIVE DYSENTERY VACCINE IN EXPERIMENTS
ON MONKEYS

Yn. A. Belaya, K. N. Kavlaradze, V. D. Gekker, E. K. Dzhikidze

Immunogenic properties of live lyophilized dysentery vaccine prepared of attentuated strain Flexner 2a were studied on 45 monkeys macaca rhesus. Of this number 25 monkeys were immunized enterally, 5 times, at intervals of 3 to 4 days with live vaccine in doses of 15—50 milliard live microbial cells. Two weeks after the immunization they were infected with 75 milliard live microbial cells of a virulent strain Flexner 2a. The incidence of the disease in the experimental group was 7.6 less than among the nonimmunized 18 monkeys. A rise of agglutinins (3—11-fold) was noted in the process of immunization; preventive properties of the sera in testing on chick embryos showed no significant changes. Bacteria of vaccine strain were isolated for 1 to 4 days from the monkeys after immunization. There occurred no restoration of the virulence.

Thus, live Flexner dysentery vaccine was shown to be areactogenic, harmless and to

possess immunological efficacy in experiments on monkeys.

"Kinetics of the Reaction of Triethyl Phosphite with Linear Halo-methylated Polystyrene"

Moscow, <u>Vysokomolekulyarnyye Soyedineniya 12</u>, No 7, 1970, pp 1608-1613

Abstract: The kinetics of the Arbuzov reaction of triethyl phosphate (TEP) with linear iodomethylated polystyrene was studied in carefully purified dioxane over the temperature range 58-97°C. It was found that at temperatures exceeding 70°, isomerization of TEP accompanies the Arbuzov rearrangement. It was shown that the reaction rate constants in the interaction of TEP with iodomethylated styrene decreases as the reaction proceeds and the apparent activation energy depends on the temperature; it is 17.1 kcal/mole

"Polarographic Study of the Arsenic (III) - Ascorbic Acid System"

Moscow, Zhurnal Neorganicheskoy Khimii, Vol 17, Vyp 3, 1972, pp 681-685

Abstract: Ascorbic acid (H₂L) forms complexes with a series of metal ions. Because As(III) forms a polarographically active complex with H₂L, it is necessary to analyze for H₂L only in a buffered solution. As(III) was determined by polarography during the reduction of Se⁺⁴ to Se⁰. The composition of the H₂L complex with As(III) has the form As(OH)₂HL. The linearity and

slope (the latter approximately one) of the pH vs log α (where $\alpha = \frac{[AsL]}{c'_{As}'_{c'}_{L}}$

the apparent dissociation constant) plot indicate that only one complex was formed. The stability constant β was determined from the equation $\text{H}_2\text{L} + \text{As } (G\text{H})_3 \overset{?}{=} \text{As } (G\text{H})_2 \text{ H}_m\text{L} + (2-m) \text{ H}^+ + O\text{H}^-$ and values of log β are numerically equal to 18.84 ± 0.11 and 18.63 ± 0.53 .

"Recommended Values of Deformation Modulus as a Function of Moisture Content and Porosity Factor"

Tr. Turkm. Politekhn. In-ta [Works of Turkmen Polytechnical Institute], No 9, 1971, pp 82-90, (Translated from Referativnyy Zhurnal, Mekhanika, No 4, 1972, Abstract No 4 V719 by K. V. Nikolayev).

Translation: Tables and graphs of the change in modulus of deformation of soils as a function of porosity factor and moisture content are presented. The data are produced using laboratory compression testing and field tests with loading by a circular stamp 79.5 cm in diameter. The compressive stresses during testing were from 1 to 3-4 kg/cm². As porosity and moisture content increased, the values of modulus decreased. Field test data for the range of change of porosity factor studied (0.6-1.0) and moisture content (0.2-0.85) are presented in a Table of values of modulus of deformation recommended for use in designing structures.

"On Factors Affecting Manifestation of the DS-Index in Viruses of the Tick-Borne Encephalitis Complex'

Moscow, Voprosy Virusologii, No 1, 1973, pp 86-91

Abstract: Differences in plaque formation in response to DS (dextran sulfate) were studied in cultures of the Khipr, Absettarov (western strains), Khabarovskiy-17, Khabarovskiy-9, and Sof'in strains, and strain TP-21 (Langat virus) (eastern strains), all of the tick-borne encephalitis complex. Viruses were cultured in SPEV-44 and chick embryo cells with varying quantities of NeHCO3 and normal calf serum in the presence or absence of chick embryo extract. DS either had no effect or reduced plaque size to varying degrees depending on the type of virus and culturing conditions. Addition of chick embryo extract to DS-treated cultures reduced plaque size further. By this method it was possible to differentiate western from eastern strains and strain TP-21 (Langat virus) from all other strains in SPEV-44 cell cultures. The ways in which culturing factors affect DS sensitivity remain unknown.

"The Effect of Sulfopolysaccharides on Plaque Formation by Tickborne Encephalitis Viruses of Different Degrees of Neurovirulence"

Moscow, Voprosy Virusologii, No 4, Jul/Aug 70, pp 395-399

Abstract: It was determined that addition of dextran sulfate (25 to 800 micro g per ml of agar to a chick embryo tissue culture with 0.22 to 0.3% NaHCO₃ does not suppress plaque formation by the virulent Absettarov strain, whereas under the same conditions the less virulent Langat virus (TP-21 strain) produces 1.5 to 2.1 g fewer plaques than under an agar layer containing diethylaminoethyl dextran or under an agar layer without polions such as DEAED. The sensitivity to dextran sulfate may serve as a new genetic marker for viruses of the tickborne encephalitis virus complex. Under an agar layer containing dextran sulfate and a low concentration of NaHCO₃ (0.07%), neither strain formed plaques.

"Kinetic Method for Determining Microgram Quantities of the Organophosphorus Compound Butifos"

Moscow, Zhurnal Analiticheskoy Khimii, Vol 27, Vyp 8, 1972, pp 1643-1647

Abstract: Microgram quantities of butifos can be determined from its catalytic properties on the oxidation of benzidine, o-dimethoxybenzidine, and dimethylbenzidine by $\rm H_2O_2$. The reaction is following photometrically. The dimethylbenzidine reaction is the most sensitive of the indicators as the methyl groups are stronger electron donors than the methoxy group. Conditions optimizing the reaction are examined. Trace amounts of butifos in the fibers and husks of cotton seeds were determined by this method.

Contamination of Food Products, Feeds and Environment), Tallin, 1971, pp
376-380 (from RZh-Khimiya, No 12, Jun 72, Abstract No 12N500)

Translation: For analysis of butyphos (I) in raw cotton and cotton fiber, the property of I to accelerate the oxidation of o-dianisidine by $\rm H_2O_2$ and retard the oxidation of hydroquinone by $\rm H_2O_2$ in the presence of $\rm Cu^{2+}$ is used. The concentration of I in the 1.25-6.25 • 10-2 $\gamma/m\,\ell$ range is determined by measuring the rate of one reaction, and the concentration of I to $\rm 10^{-14}~\gamma/m\,\ell$ by measuring the rate of the second reaction. The reaction rate is determined by the fixed time method, measuring the optical density of these solutions 20 minutes after mixing the solutions in the first case and 5 minutes after in the second case.

"Investigating Multiple Scattering of Light"

Leningrad, Optika i Spektroskopiya, Vol 31, No 5, 1971, pp 788-795

Abstract: This article is the continuation of an earlier paper by the same authors in the same journal (28, 1970, p 504). The earlier paper represented research into the scattering of light in polystyrol latexes, in which data was obtained on the dependence of the multiple dispersed light intensity on the depth of the dispersing medium. The present article discusses the results of the experiments described in the first, which showed that if a parallel beam of light is normally incident on the base of a cylinder made of the dispersing material, the intensity of the scattered light dies away exponentially as a function of the depth. In the present article, the physical significance of one of the factors in the exponent, the attenuation factor of the repeatedly scattered light, is examined. A method is also proposed for the separate determination of σ and α , the coefficients of light scattering and absorption respectively, which requires no new equipment except for a modification of the ordinary spectrophotometer.

"Distribution of the Concentration of an Impurity Entering the Atmosphere From a High-Altitude Continuous Point Source"

Tr. In-t eksperim. meteorol. Gl. upr. gidrometeorol. sluzhby pri Sov. Min. SSSR (Works. Institute of Experimental Meteorology. Main Administration of the Hydrometeorological Service Affiliated With the Council of Ministers of the USSR), 1972, vyp. 27, pp 70-76 (from RZh-Mekhanika, No 7, Jul 72, Abstract No 78988)

Translation: Taking the numerical solution of the two-dimensional equation of turbulent diffusion as a basis, the authors find the distribution of an impurity S(x,z) entering the atmosphere from a continuous high-altitude point source (the x-axis is parallel to the wind, the z-axis is directed vertically upward). The function S(x,z) is related to the volumetric concentration q(x,y,z) by the expression

$$q(x, y, z) = \frac{e^{-v^2/2\sigma_y^2}}{(2\pi\sigma_y^2)^{1/2}} S(x, z)$$

1/2

CIA-RDP86-00513R002200720015-2

USSR GISINA, F. A. et al., <u>Tr. In-t eksperim. meteorol. Gl. upr. gidrcmeteorol.</u> sluzhby pri Sov. Min. <u>SSSR</u>, 1972, vyp. 27, pp 70-76

where σ_y^2 is the dispersion of the particles of impurity in the direction of the y-axis.

In determining S(x,z) use was made of the wind speed profiles and the coefficient of turbulence found by Bobyleva, Zilitinkevich and Laykhtman from a closed system of equations for the boundary layer. The external parameters of the problem are the Rossby number $R=G/\lambda z_0$, and the stratification parameter

$$\mu = -x^2 \frac{g}{T} \frac{P/C_p \rho}{\lambda V_p^2}$$

where G is the geostrophic wind, $\lambda=2\omega\sin\phi$ is the Coriolis parameter, z_0 is the roughness parameter, $V_{\#}$ is the dynamic velocity, P is the turbulent heat flux and the remaining notation is conventional.

The calculation was done on a computer. A study was made of the effect of external parameters and physicochemical characteristics on impurity distribution. Some results of the numerical solution are given. Authors' abstract.

"Lining Smelting of Briquetted Titanium Sponge"

Moscow, Tsvetnyye Metally, No 10, Oct 73, pp 41-42

Abstract: The authors study the possibility of using pressed titanium briquets without presmelting as consumable electrodes. This involved the selection of the optimal technological parameters which would ensure smelting stability. The solution of this problem would make shaped casting inexpensive. The smelting was conducted in a lined vacuum arc furnace designed by VIAM (All-Union Scientific Research Institute of Aviation Materials). The TG-100, TG-120, and TG-ChM grades of titanium sponge were used as the charging material. The sponge was pressed in the B-654 briquet press at 630 tons into briquets of 140 and 160 mm in diameter and 120 mm high. In all more than 50 smelts were conducted. It was shown that sponge quality during the smelting of briquets made from the TG-100, TG-120, and TG-4M grades did not affect smelting. The visually observable gas generation was practically the same or significantly greater than during the smelting of monolithic electrodes. An attempt to reduce gas generation by smelting in a helium atmosphere proved unsuccessful. The pressed electrodes also need more heat than the monolithic electrodes since their thermal conductivity and density are lower. It was also shown that the use of large diameter electrodes is more advantageous. During test-1/2

VYATKIN, I. P., et al, Tsvetnyye Metally, No 10, Oct 73, pp 41-42

ing the obtained liquid metal was poured into forms, producing either ingots or shaped parts. Specimens were cut from these and their chemical composition and mechanical properties determined. The corrosion resistance of these specimens was determined using standard methodology in HCl gas and acid media. The corrosion rate was quite high during the first 800 hours and reached maximum at 150-200 hours. Specimens made from TG-ChM corrode more than specimens made from TG-100. As the test duration is increased, the difference in the rate of corrosion diminishes and becomes identical.

Measurement of Low-Energy Electrons

(Abstract: "Measurement of Low-Energy Electrons," by Yu. I. Gal'perin, N. V. Dzhordzhio, I. D. Ivanov, I. P. Karpinskiy, E. L. Lein, T. M. Mulyarchik, B. V. Polenov, V. V. Temnyy, N. I. Fedorova, B. I. Khazanov, A. V. Shifrin and F. K. Shuyskaya; Moscow, Kosmicheskiye Issledovaniya, Vol VIII, No 1, 1970, pp 108-119)

[Note: This is part of a sectionalized article "Study of Geoactive Corpuscles and Photoelectrons on the Satellite 'Kosmos-261'," Kosmicheskiye

Issledovaniya, Vol VIII, No 1, 1970, pp 104-136]

A spectrometer for low-energy electrons, operating in the energy range 30 eV-15 keV, is described. Electrons undergo energy selection in a cylindrical capacitor and then are accelerated to 17 keV and are registered by a scintillation counter with two photomultipliers operating in a coincidence circuit. The instrument field of view is circular, the aperture angle is +3.5°, the geometry factor is 2·10-3 cm²·sterad and the energy resolution is $\Delta E/E = 0.19$. In the first range (30-150 eV) energy scanning is done smoothly by applying a sawtooth voltage; in the second analysis it is done smoothly at three fixed energies -- 1, 4.5 and 15 keV. The instrument can be switched from one regime to another by command from

the earth. The paper gives the first results of measurements on the "Kosmos-261" satellite. The instruments measured the equilibrium energy spectrum of fresh photoelectrons at different latitudes for different pitch angles. Soft auroral electrons with energies from 30 eV to approximately 1 keV were registered both in the "second" zone of auroras and in the main zone of auroras in which electrons with energies 4.5 and 15 keV were also very intensive even during magnetically quiet times. On many revolutions of the satellite about the earth, passing approximately along the auroral oval, with transition from the midnight to the morning sectors there is a structureless "background" of electrons with an almost constant intensity ani slowly changing angular distribution. The energy flux of these electrons is approximately 1 erg/cm²·sec. Near the midnight sector and with transition from the midnight to evening sector the fluxes of auroral electrons are far more irregular, with strong peaks, particularly at about 4.5 keV. No measureable electron intensities were discovered in the middle and low latitudes in the keV range. The upper limit of the energy flux in the quiet atmosphere is approximately <1.5·10-2 erg/cm²·sec. An exception is the equatorial region of the ionospheric anomaly, where as earlier (on the "Kosmos-5" satellite) there was sporadic registry of soft electrons.

Study of Geoactive Corpuscles and Photoelectrons

(Abstract: "Study of Geoactive Corpuscles and Photoelectrons on the 'Kosmos-261' Satellite," by A. D. Bolyunova, M. L. Bragin, Yu. I. Gul'-perin, V. A. Gladyshev, N. V. Dzhordzhio, G. R. Zlotin, I. N. Kiknadne, R. A. Kovraznkin, T. M. Mulyarchik, Yu. N. Ponomarev, V. V. Tamayy, N. I. Fedorova, Yu. P. Shilyayev, F. K. Shuyskaya and R. V. Shulenina; Moscow, Kosmicheskiye Issledovaniya, Vol VIII, No 1, 1970, pp 104-136)

The artificial earth satellite "Kosmos-261" was used in a study of

The artificial earth satellite "Kosmos-261" was used in a study of low-energy geoactive corpuscles and fresh photoelectrons and their interaction with the earth's upper atmosphere. The satellite was launched on 30 December 1968. Orbital inclination to the equator was 71°, so that for a relatively long time it moved almost along a tangent along the auroral zone over the Soviet Far North, making it possible to increase the volume of simultaneous measurements from the satellite and from ground observatories. The storage regime made it possible to extend continuous measurements for periods of several revolutions, including passes over the auroral zones in the Arctic and Antarctic and over the polar caps as far as invariant geomagnetic latitudes 82-85°. During the initial period the satellite apogee was at 670 km and perigee was at 217 km, but it finally

AP0042570.

burnt up upon entering into the dense layers of the atmosphere on 12 February 1969 after making 857 revolutions of the earth. The experiment lasted 53 days. The orbit was such that in the northern hemisphere middle and high latitudes the satellite moved below or close to the maximum of the Foregion so that ionospheric electron density along its trajectory and its variations could be determined in a number of regions on the basis of measurements by ground ionospheric stations. The period of the experiment included both quiet periods and those with strong disturbances. The experiment was conducted under the "Program of Cooperation Among Socialist Countries in the Field of Space Research and Peaceful Use of Space." Ground measurements were made in Bulgaria, Hungary, East Germany, Poland, Rumania, USSR and Czechoslovakia. Observatories and special expeditionary stations in the USSR participated: in Yakutia, the Far North, Siberda and middle latitudes. The article cited below is divided into four parts: 1) Description of Experiment; 2) Measurement of Low-Energy Electrons; 3) Measurement of Low -Energy Ions; 4) Measurements of Charged Particles with Intermediate and High Energies. Parts 2)-4) are essentially independent articles and are abstracted separately.

"Theory of Factorization and Boundary Properties of Functions Meromorphic in

Moscow, Uspekhi Matematicheskikh Nauk, Vol 28, vyp 4(172), Jul-Aug 73, pp 3-14

Abstract: A problem related to the fundamental Nevanlinna theorem on the parametric representation and factorization of a class N of functions F(z) meromorphic in the circle |z| < 1 and the fact that the method of proving the theorem rests essentially on the Jensen-Nevanlinna formula is whether there are other more general formulas of the Jensen-Nevanlinna type which would permit the establishment of parametric representation and factorization for classes which are wider or narrower than N. In the 1940s the author made the first attempt towards solving problems of this kind, though the result was far from perfect. In 1964 the author returned to the problem of the factorization of meromorphic functions in an expanded formulation, constructing a general theory of the parametric representation of the classes $N_{\infty}(-1 <$

APPROVED FOR RELEASE: 07/20/2001 CIA-RDP86-00513R002200720015-2"

DZHRBASHYAN, M. M., Uspekhi Matematicheskikh Nauk, Vol 28, vyp 4(172), Jul-Aug 73, pp 3-14

 $\alpha < +\infty$) of functions meromorphic in the circle |z| < 1. A fundamental theorem was given on the parametric representation of the classes N_{α} . However, despite its considerable generality, the theory of factorization of the classes N_{α} could not be considered definitive, and arose the problem of constructing a complete theory of the factorization of functions meromorphic in the circle |z| < 1. Such a theory was constructed by the author in articles that appeared in 1968 and 1969.

The present article, which was a paper delivered at a meeting of the Mathematics Department of the Academy of Sciences USSR on 2 March 1973, sumof the factorization of the classes $N(\omega)$. As an example, the article gives results that are fundamentally important for the theory of the classes $N\{\omega\} \subset N$ and their boundary properties.

"Uniqueness Theorems for Several Classes of Analytic Functions"

Moscow, Izvevtiya Akademii Nauk SSSR--Seriya Matematicheskaya, No 1, 1973,

Abstract: In an earlier paper of the first of the authors named above (Rasshireniye kvazianaliticheskikh klassov Danzhua-Karlemana -- Broadening the Denjoy-Carleman Quasi-Analytic Classes -- Izv. AN ArmSSR, Matematika, vol 3, No 3(1968), pp 171-248) the concept of alpha quasi-analyticity was introduced. This concept involved Hadamard-Denjoy-Carleman classical quasi-analyticity. The solution to the problem of alpha quasi-analyticity can be solved by reducing it to the Watson problem through the theory of integral transformations of the functions with Mittag-Leiffler kernels, a method also developed by the first of the authors named above (see Dzhrbashyan, M. M., Integral'nyye preobrazovaniya i predstavleniya funktsiy v kompleksnoy oblasti -- Integral Transformations and Representation of Functions in the Complex Region -- "Nauka," Moscow, 1966). In the present paper, further applications of this method of integral transformations are given. Through further generalization of the method, uniqueness theorems for some classes of analytic functions are developed.

"Continuity and Uniqueness of a Dirichlet-Type Series on the Real Axis"

Yerevan, Izvestiya Akademii Nauk Armyanskoy SSR: Matematika, July-August 1972,

Abstract: In the article the author develops a theory on the continuity and

$$\sum_{j=1}^{\infty} d_j e^{-\lambda_j x} x^{s_{j-1}}$$

on the real axis in the L₂ metric. This is done on the assumption that the powers $\{\lambda_i\}_1^\infty$ of this series are arbitrary, complex numbers from the half plane Re z>0 subject only to the condition

$$\sum_{l=1}^{\infty} \frac{\operatorname{Re} \lambda_l}{1+|\lambda_l|^2} < \infty.$$

1/2

DZHRBASHYAN, M. M., Izvestiya Akademii Nauk Armyanskoy SSR: Matematika, July-August 1972, pp 258-274

The number $s_j > 1$ is the multiplicity of the occurrence of the number λ_1 in the segment $\{\lambda_1, \ldots, \lambda_i\}$ of the sequence.

It is noted that in the case of the real axis considered in the article the well-known method for a theory of the continuity of ordinary Dirichlet series in strip regions, developed by S. Mandelbroyt ("Continuous Series. Regularization of Sequences. Applications." Publishing House of Foreign Literature; Moscow; 1955), loses its force.

There are 10 bibliographic references.

"Factorization of Functions Meromorphic in a Finite Plane"

Yerevan Izvestiya Akademii Nauk Armyanskoy SSR, Matematika, No 6, November-December, 1970, pp 453-485

Abstract: This paper contains an investigation of the problem of factorization of functions which are meromorphic in an entire finite plane. With respect to concept and method it is a further application and expansion of the concept and method of the paper by M. M. Dzhrbashyan "Theory of Factorization of Functions Meromorphic in a Circle," Mat. sb. [Mathematics Collection], Vol 79 (121), No 4 (8), 1969, page 517-615, in which the complete theory of factorization of functions meromorphic in a circle was constructed by systematic application of the apparatus of generalized operators of the Riemann-Liouville type $L^{(\omega)}$. A brief review of some of the basic results of the Dzhrbashyan paper is presented as a basis for further discussion. The discussion includes a formula of the Jensen-Mevanlinna type, definition and basic properties of the ω -characteristic of the function $T_m(R;F)$, and the factorization theorem. The main theorem proved covers meromorphic functions with characteristics of arbitary increase. It is formulated

"Boundary Characteristics of Subclasses in the Bounded Form of Meromorphic Functions"

Moscow, Izbestiya AN SSSR, Seriya Matematicheskaya, Vol 34, No 6, November-December 1970, pp 1262-1339

Abstract: This paper is an investigation of class N functions of the bounded Nevanlinna form, meromorphic in the circle |z| < 1, with the important boundary condition that if $F(z) \in N$, the finite radial limit

$$F(e^{i\theta}) = \lim_{r \to 1-0} F(re^{i\theta}), \quad \theta \in (0,2\pi),$$

exists for all θ , with the possible exception of an excluded set $E\subset /0,2\pi/$ of zero linear dimensions. In this connection, the authors discuss the work of Frostman, Blaschke, and Carleson. Regarding the problem of constructing a complete theory of the fac-

"The Influence of the Herbicides 2.4-D on Wheat and Barley"

Moscow, Zashchita Rasteniy, No 4, 1972, p 29

Abstract: Winter wheat can be cultivated with a 0.5-2.0 kg/hectare dose of crotylin in the tillering stage as well as in the stooling stage, but spring wheat can be sprayed only in the tillering stage (0.3-0.6 kg/hectare). Spring barley should be sprayed only in the tillering stage: crotylin 0.3-0.5; sodium salt 2.4-D 1.0-1.5; amino salt 0.75-1.1 kg/hectare. Late spraying deforms barley ears. The herbicides increase the quantity of nitrogen, thus reducing the yield of grain, and greatly decrease the quantity of carbohydrates in the grain.

"Circular Holographic Recording in Opposed Beams"

Moscow, Zhurnal Nauchnoy i Prikladnoy Fotografii i Kinematografii, Vol 18,

Abstract: The paper describes a system of holography in which the film takes the form of a cylinder surrounding the object, and the reference and object waves travel in opposite directions (reflection holography). The main advantage of this method is that it permits use of a more diffuse and less monochromatic light source in reconstruction of the wavefront. The reference beam is shaped into a conical wave which is then reflected from the inside surface of a cylindrical mirror from which it is sent to the object. A helium-neon laser was used in holography, and the STs-61 incandescent lamp was used in reconstructing the wavefront. Shrinkage of the emulsion is an important factor, especially since the image is curved. A formula is given for the limiting angular field of view. The authors thank A. V. Borin and N. S. Gafurova for supplying the high-resolution holographic film. 1/1

One Statistical Model of an Elementary Biological System

Riberneticheskiye Aspekty v Izuchenii Raboty Mozga (Cybernetic Aspects of the Study of the Brain's Functioning), Moscow, Nauka Publishing House, 1970, rp 215-222

Abstract: A statistical model of an elementary biological system is examined; it takes into account scmewhat approximately the well-known knowledge of electrophysiclogy of recent years and also some hypotheses suggested by the authors.

Modeling on a digital computer is the method of study employed.

The operation algorithm of the system is broken down into four stages: 1] *peripheral tocking, 2) transmission of information along ecomunication channels from receptors to synaptic knobs, 3) synaptic transmission, and 4) integration of information received in the cell. Analytical descriptions of all four stages of the system's operation have been obtained.

"The Influence of Ziziforin on the Activity of the Oxidative Enzymes During Hypoxia"

Alma-Ata, Izvestiya Akademii Nauk Kazakhskoy SSR, Seriya Biologicheskaya, No 4, Jul/Aug 73, pp 69-72

Abstract: The effect of ziziforin administration on succinate dehydrogenase, lactage dehydrogenase, alphaketoglutarate dehydrogenase and cytochrome oxidase in the tissues of the myocardium, liver and kidney of white rats which had been subjected to moderate chronic hypoxia was investigated. It was found that the activity of all the enzymes increased in the experimental animals compared to untreated controls subjected to hypoxia. This result is said to indicate that ziziforin increases the resistance of cells to hypoxia by activating these enzymes.

A70-24319 Small vibrations of systems with a solar sail (0 malykh kolebanijakh sistem s solnechnym parusom). All Decomposition of M. I. Kiseley. Kosmicheskie Issledovanija, vol. 8,

Jan. Feb. 1970, p. 148, in Russian.

Approximate solution of the problem concerning the effect of small natural vibrations of a system propulsed by a solar sail on the motion along a helicoentric orbit: It is found that the resonance effects arise during a perturbed motion when the natural vibrations of the sail are equal to its angular rotation rate.

"Effect of Preliminary Conditioning on Oxygen Pressure in the Cerebral Cortex During Gradual High-Altitude Hypoxia"

Moscow, Doklady Akademii Nauk SSSR, Vol 195, No 1, 1970, pp 252-255

Abstract: Adaptation to the discontinuous action of high-altitude hypoxia has a significant effect on the resistance of the cerebrum to oxygen insufficiency. This effect is considered to be due to the combination of two mechanisms acting at two different levels. One of these mechanisms enhances the transport of oxygen to the brain. The dynamics of the oxygen pressure in the cerebrum of trained and untrained rats subjected to stepwise "ascent" in a pressure chamber was studied polarographically. The O2 pressure was measured chrono-amperometrically with a 100-micron Pt electrode which had been inserted 500 microns deep into the rats' brains. For each experiment, the electrodes were calibrated in solutions of known O2 content. Four series of experiments were run, with 11-12 animals in each series. In the first series, untrained animals were tested; in the other series, the

animals were trained for periods of 10, 20, or 40 days. Training consisted of keeping the animals in the pressure chamber for 6 hours each day, with the pressure simulating that at an altitude of 1,000 m on the 1st day, 2,000 m on the 2nd day, 3,000 m on the 3rd day, 4,000 m on the 4th day, 5,000 m $\,$ on the 5th and 6th days, 6,000 m on the 6th and 7th days, and 7,000 m for the remainder of the training period. Some measurements were made with the test animals at a simulated altitude of up to 12,000 m. The results of the measurements were tabulated. It was found that at a height of 4,000 m the drop in cerebral oxygen pressure is still almost the same for both trained and untrained groups. At greater altitudes, the difference between trained and untrained groups becomes more obvious. After 20 and 40 days of training, it was found that protein synthesis in the blood was increased by 60-80%. It is speculated that ATP may be used in the adaptation of the blood to the surrounding medium. It is concluded that, whereas up to a height of 6,000-7,000 m trained alpinists may not experience any discomfort, at higher altitudes disturbances in brain functions may occur. 2/2

Concerning The Choice Of Receiving Antenna Polarization In Radar Stations With A Synthesized Aperture

Radiotekhnika i elektronika, Vol XVII, No 3, Mar 1972, pp 488-492

Abstract: Previous works have shown that in principle the resolution of radar systems with a synthesized aperture (RSA) can be improved by the method of polarized selection of target and background signals. In the present paper the possibilities are considered of such an increase of the resolution of RSA under the condition of steadiness and ergodicity of the interference reflections. The results obtained can be used in all areas of radio engineering where antenna arrays are used (radio astronomy, radio navigation, etc.) for an evaluation of the gain in the resolution because of polarized selection. 1 fig. 9 ref. "Phosphorylation of 10-(2,3-Epoxypropyl)phenothiazine"

Leningrad, Zhurnal Obshchey Khimii, Vol 41, No 10, 1971, pp 2207-2209

Abstract: In a continuing search for physiologically active phenothiazine derivatives, a study was made of the reaction of 10-(2,3-epoxypropyl)phenthiazine with \(\beta\)-alkoxyvinylphosphonic anhydrides, thio- and dithioanhydrides. A series of previously unknown crystalline heterocyclic esters were prepared by the cited reaction. The reaction with thioanhydrides gave the esters with a 1,2,3-oxaphosphathiazole ring structure, as indicated by their IR spectra. The yields, mp, and elemental analysis data of the products are tabulated and their preparation is described.

"Phosphorus-containing Phenothiazine Derivatives"

Leningrad, Zhurnal Obshchey Khimii, Vol 41, No 1, Jan 71, pp 110-114

Abstract: In searching for physiologically active substances the authors synthesized previously unknown phosphates, phosphonates and thiophosphonates of phenothiazine derivatives with residues of phosphorus acids bonded to the nitrogen atom of the phenothiazine nucleus by a hydrocarbon chain. [eta -(Phenothiazinyl-10) isopropyl] phosphates were obtained by the reaction of chlorophosphates with 10-(β -hydroxypropyl)phenothiazine. Bis[β -(phenothiazinyl-10)1sopropyl] methylphosphonate was obtained from methylphosphonic acid dichloride and 10-(B -hydroxypropyl)phenothiazine. [B-(Phenothiazinyl-10) isopropyl] diethylthiophosphinate was obtained from the diethylamide of diethylphosphinous acid and 10-(\beta-hydroxypropyl)phenothiazine with subsequent addition of sulfur to the phosphinite. Sodium phenothiazine reacts with diethyl esters of chloromethyl- and B-chloroethylphosphonic acids to give N-ethylphenothiazine and diethyl [/ - (phenothiazinyl-10)ethyl] phosphonate respectively. The oxidation of [β -(phenothiazinyl-10)isopropyl] phosphates was studied. 1/1

"Synthesis and Properties of β -Alkoxyvinylphosphonic Anhydrides I."

Leningrad, Zhurnal Obshchey Khimii, Vol 40, No 9, Sep 70, pp 1968-1970

Abstract: To the dichloroanhydride of β -ethoxyvinylphosphonic acid in anhydrous toluene, water was added dropwise at 20° followed by heating the reaction mixture for 2 hrs at 110° under a stream of nitrogen. The solvent was evaporated and the residue kept 2-3 hrs at 2-3 mm vacuum and 100-110° to yield the anhydride of β -ethoxy-vinylphosphonic acid (I), m.p. 75-76°, a thermally stable hydroscopic, brittle material. Another way of obtaining (I) was by adding water to the starting dichloroanhydride kept in anhydrous benzene-pyridine mixture; absolute methanol could be substituted for water. To obtain a monoalkyl ester, (I) dissolved in anhydrous benzene or toluene was refluxed 6-10 hrs with anhydrous alcohol in a dry atmosphere. After removing the solvent, the residue was kept at 90-110°/7-8mm for 2-3 hrs, yielding the product -- dark syrupy 1/2

"A Method of Making β-Alkoxyvinylphosphonic Acid Anhydrides"

Moscow, Otkrytiya, Izobreteniya, Promyshlennyye Obraztsy, Tovarnyye Znaki, No 27, 1970, Soviet Patent No 279615, Class 12, filed 6 May 69, p 29

Abstract: This Author's Certificate introduces: 1. A method of making β -alkoxyvinylphosphonic acid anhydrides. As a distinguishing feature of the patent, β -alkoxyvinylphosphonic acid dichloride is interacted with water, and conventional methods are used to remove the hydrogen chloride which is released. 2. A modification of this method distinguished by the fact that the process is carried out in an organic solvent such as benzene.

"Synthesis and Properties of β -Alkoxyvinyl Phosphonic Anhydrides"

Leningrad, Zhurnal Obshchey Khimii, Vol 40, No 9, Sep 70, pp 1971-1973

Abstract: A new method for the synthesis of anhydrides of β -alkoxy-vinylphosphonic acid (I) is described, consisting of the reaction of equimolar quantities of the dichloroanhydride with the complete ester of β -alkoxyvinylphosphonic acid. The product is a monomer. To obtain β -propoxy-c-methylvinylphosphonic anhydride, (I) in an absolute benzene pyridine mixture is reacted with absolute methanol. The reaction mixture is refluxed for 5 hrs, precipitate separated, filtrate washed with benzene, solvent evaporated, and residual mass kept for 1-1.5 hrs at 80-100/10-15 mm. These anhydrides react with epoxides to yield five membered cyclic esters. The epoxides are added in ice followed by heating the reaction mixture for 6-7 hrs to 70-100°.

"Organophosphorus Derivatives of Piperazines"

Frunze, Izvestiya Akademii Nauk Kirgizskoy SSR, No 4, Jul-Aug 73, pp 47-49

Abstract: Reaction of monosubstituted amyl- and benzylpiperazines with phosphonic acid dichlorides and phenylamidophosphoric acid chloride in presence of dry triethylamine yields novel amidophosphonates and amidophosphates. All of the amidophosphonates are crystalline products; the di(1-amylpiperazinyl-4) phenylamidophosphate is an oily product which can be isolated by conversion to a picrate. Another possible synthetic method for amidophosphates is based on the reaction of monoamylpiperazine with dialkyl(aryl)phosphoric acid chlorides in benzene and in presence of dry triethylamine.

"Adaptation Mechanisms of the Cerebral Cortex and of Skeletal Euscles to Hypoxia"

Frunze, Sovetskeye Edraveckhraneniye Kirgizii, Ko 2, Mar/Apr 72, pp 7-10

Abstract: The utilisation of oxygen by the cerebral cortex and skeletal nuscles was determined on the basis of the rate constant of oxygen consumption (RCOC). The control group of rats was kept in Frunze and the experimental group was taken to a 3,200 m elevation, where pO₂ was 103 mm Hg. Consumption of oxygen by the brain tissues was recorder by platinum electrodes implanted at a depth of 500 \mathcal{M} . The RCOC by the brain cells was 0.0119, 0.0073, 0.0077, 0.0084, 0.0042, 0.0044 on the 3d, 10th, 20th, 30th, 45th, and 60th days at 3,200 m, respectively (controls 0.0055). Physical exercices 0.0038, 0.0046, 0.0044, respectively (control 0.0054). The BCOC of the calf nuscles was 0.0300, 0.063, 0.073, 0.11, 0.23, 0.24 without emercises (control 0.091), and 6.161, 0.161, 0.173, 0.18, 0.17, 0.18 (control 0.145)

APPROVED FOR RELEASE: 07/20/2001 CIA-RDP86-00513R002200720015-2"

USSR

EPSHTEYN, I. M., et al., Sovetskoye Zdravockhraneniye Kirgizii, No 2, Mar/Apr 72, pp 7-10

with exercises. A lower RCOC in the cerebral cortex than in the calf muscles is attributed to the presence of glial cells in the brain which are characterized by a slow oxidative process. The physical exercises inhibited to some extent the oxidative processes in the brain, although the initial adaptation stages to the hypoxia are characterized by acceleration of the excitation processes in the cerebral cortex. Sharply reduced exygen consumption by the calf muscles during the first several days at 3,200 m is attributed to low permeability of the muscle fibers by oxygen. The oxidative activity in the same muscles increased considerably after physical exercises. Evidently the physical load is more powerful factor than hypoxia with respect to oxygen consumption by muscles.
